

**W3C Workshop on**

**Languages for Privacy Policy Negotiation  
& Semantics Driven Enforcement**

**Ispra, 17-18 Oct 2006**

# **Flexible and Usable Policies**

P.A. Bonatti, University of Napoli "Federico II"  
and coordinator of

- **REVERSE** is one of the 2 EC FP6 Networks of Excellence devoted to the SW
  - Ranked 6<sup>th</sup> among 1-1.5K IST proposals in FP6
  - 27 institutions (academy + industry)
  - > 5 million euro
  - focussed on rule-based techniques
  - policies identified as crucial area
  - WG I2 devoted to *policy specification, composition, conformance*
  - using a broad notion of policy – today we focus on *privacy*

# From Access control to Privacy policies

- Same goal
  - Protecting confidentiality
- Local and Remote access control
  - Sticky policies
    - Nonstandard integration & (law) compliance needs
- Under extreme flexibility requirements
  - Interacting with all sorts of services (**interoperability**)
    - Navigating the Internet, Pervasive computing, ...
  - In **extremely dynamic contexts**
    - New business models, virtual organizations
    - Fast & easy composition / integration / harmonization
    - Pervasive computing environments – time & location
    - Walking through an airport, sharing info with new friends, using airport services, ...
- New, more expressive languages are needed

# Importance of user awareness & control

- Automated information negotiations
  - Essential for usability, but
  - Users may lose control
  - What information is released and when?
  - Explaining policies & negotiations
- No *one size fits all* information release policies
  - In security default policies have already proved their limits
  - Policy personalization should be at everybody's reach
  - User-friendly personalization for untrained users

# Mechanisms for Privacy Policies

## extend standard mechanisms

- Trust-based disclosure decisions, info negotiation
  - Example: Credential negotiation
  - From need-to-know to need-for-goal (purpose based)
  - Balancing risks and benefits
  - Minimizing the amount and sensitivity of disclosed information
  - New languages before new enforcement mechanisms
- Policy matching and comparison for
  - Disclosure decisions (compliance with privacy requirements)
  - Service selection
- Policy negotiation
  - Conflict resolution
  - Preference handling
  - Incentives to information disclosure
- Explanation facilities & Controlled NL Front ends

# Semantic processing

## more than interoperability

- Heterogeneous policies
  - Ontologies for interoperability & integration
- One policy, many uses
  - Enforcement, negotiation, comparison, explanation, ...
  - Policies as knowledge bases
    - b.t.w. policies may contain ontologies...
  - Declarative policy languages are needed
    - enhance also user awareness & control...

# **PROTUNE**

## **REWERSE's Trust Negotiation Framework**

# Current state & work in progress

## To be released by Dec 2006 on sourceforge

- Locally enforced, trust-based privacy policies
- Policy-driven negotiations
- Explanation facility
  - Policies and negotiations

## Sticky policies (nonlocal enforcement)

- Joint work with M. Winslett and C. Zhang in CCS 2005

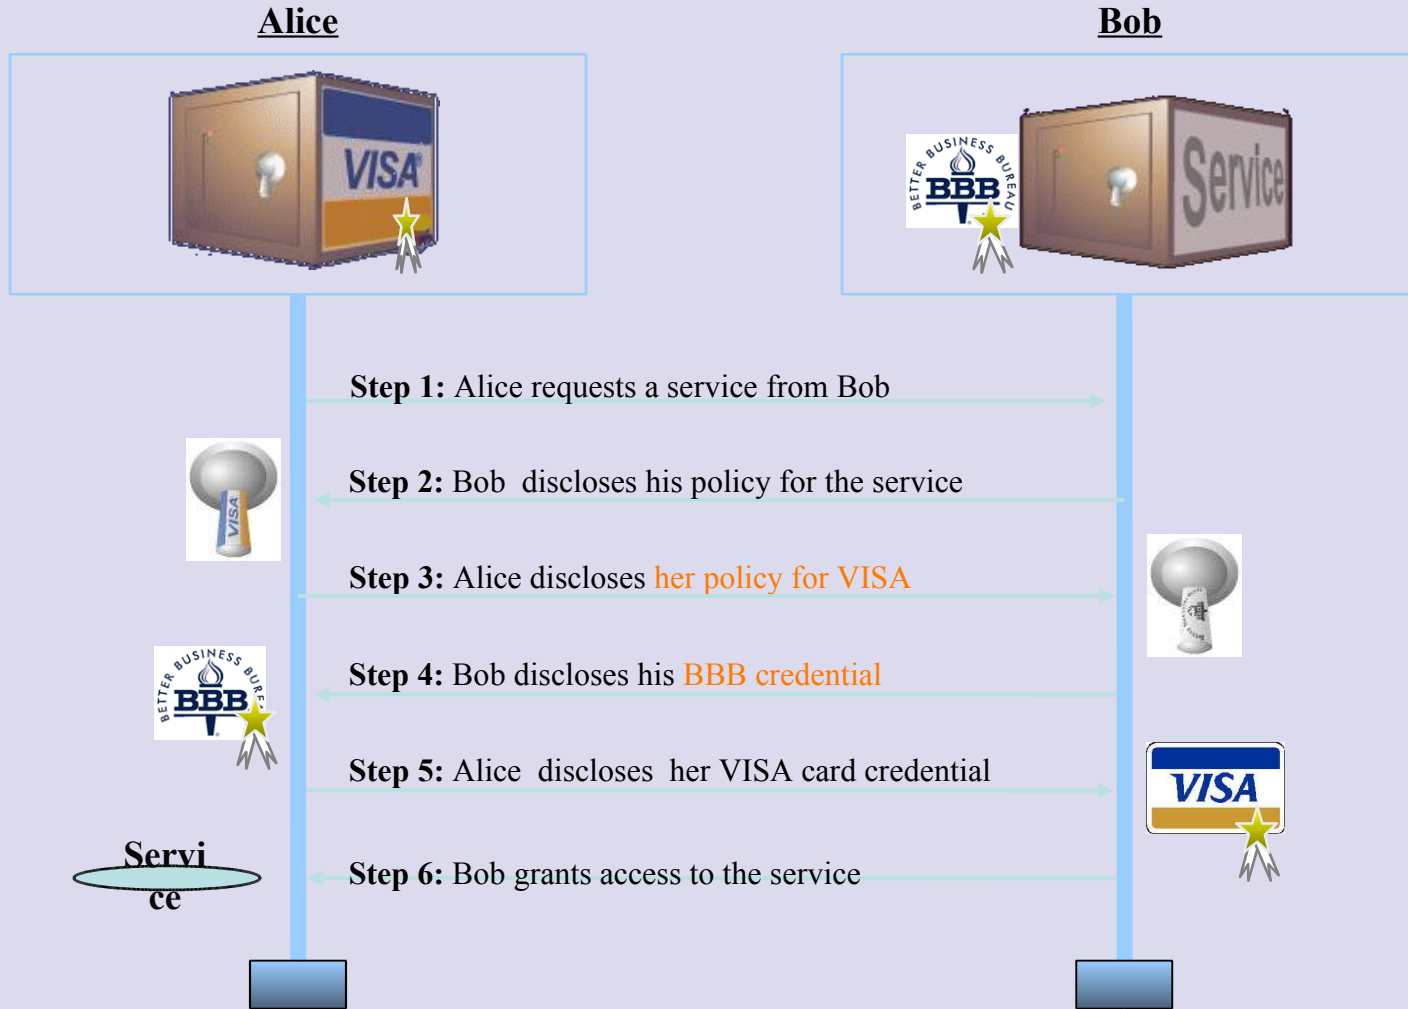

## Future work

- More on sticky policies
- Policy comparison & negotiation
- Protune on small mobile appliances

# Policy-driven Negotiations

## uniform treatment of all policies

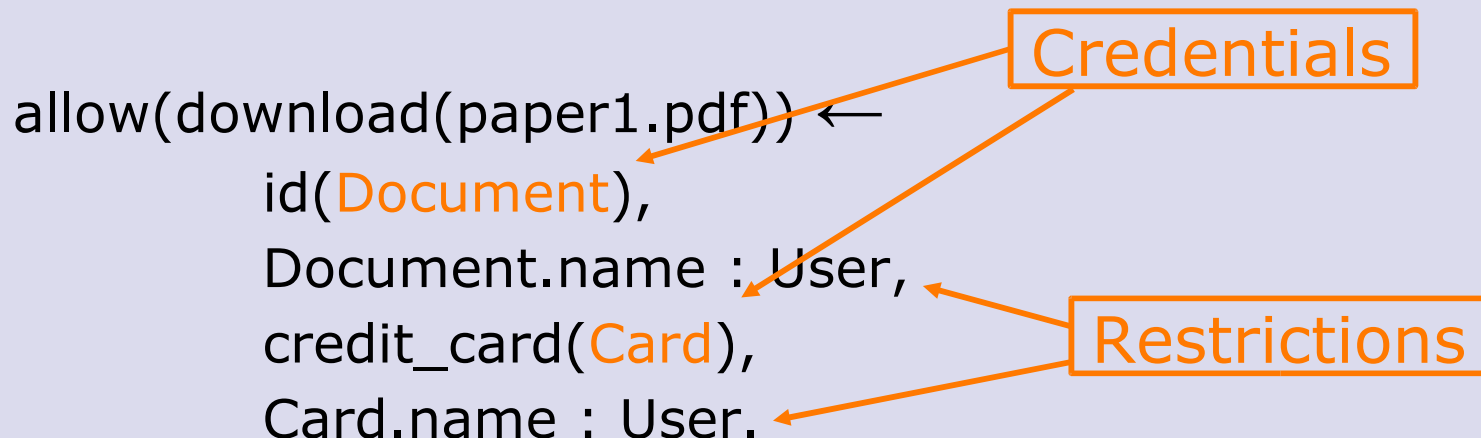

[ Bonatti, Samarati. **A Uniform Framework...** CCS 2000 and J. of Comp. Security 2002 ]

# The policy language

## how to represent Bob's policy

- Protune adopts **rules** (natural!)
- Arbitrary boolean **combinations** of items
- **Restrictions** on their attributes
- Possibly **recursive** conditions
  - Credential chains ( $\sim$  transitive closure)

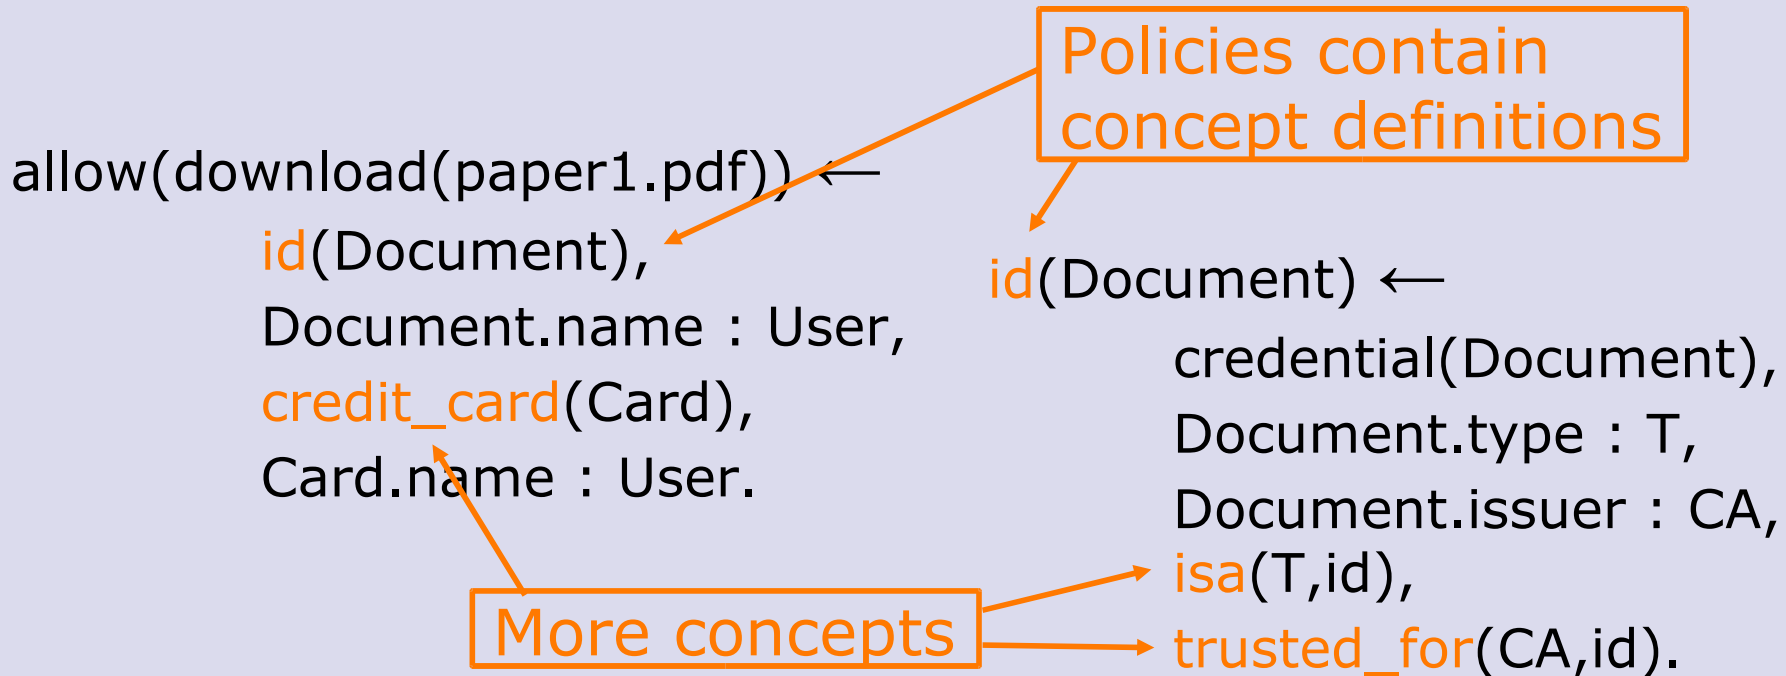

# The policy language

## how to represent Bob's policy

### ■ Policies may define **concepts**

- Policies may include ontologies
- Released along with requirements to explain them in a machine readable format

# The policy language

## Alice's privacy policy

- Expressed in a uniform way

```
release(visa_card, Requester) ←  
  BBB_member(Requester),  
  purpose : purchase(Item),  
  Item.cost > 100.
```

Decision based on  
trust, purpose and risk

```
BBB_member(Requester) ←  
  credential(C),  
  C.issuer : "BBB",  
  C.public_key : TheKey  
  challenge(Requester, TheKey).
```

Ontology

# Minimal shared language

- Defined concepts are eventually grounded on a small number of primitives
  - X.509 credentials
  - declarations (similar to web forms)
  - connect(URI), challenge (actions)
- Based on which a negotiation engine may
  - Submit the required info (if the disclosure policy permits)
  - Execute an action (if the policy permits)
  - Query the user first (if the policy says so)
  - Refuse to comply (the negotiation may fail or proceed differently)

# Minimal prerequisites for application

## A common understanding of

- Rule semantics
- The shared primitives
  - Credential format (X.509 standard), declaration forms, connect and challenge
- No further semantic infrastructure needed
- Lightweight reasoning (Horn clauses)

## Claim

- Technologically feasible
- Even on small mobile appliances

# Policies are not (only) passive objects

## Policies may specify

- Event logging
- Communications and notifications
  - e.g. query-the-user
- Workflow triggering
  - such as (partly) manual registration procedures

## i.e. Policies may specify **actions**

- To be interleaved with the decision process

# Strong, Soft, and Lightweight Evidence

## Trust sources

- Strong evidence
  - e.g. **digital credentials** (id, credit cards, subscriptions)
- Soft evidence
  - e.g. **numerical reputation measures**
- Lightweight evidence
  - e.g. **“accept buttons”** (copyright/license agreements)

## They can be integrated for balancing:

- trust level
- risk level
- computational costs
- usability (fetching credentials, personal assistants)

# Strong, Soft, and Lightweight Evidence

## How can individuals *prove* their eligibility?

- Strong evidence
  - e.g. **digital credentials**
- Soft evidence
  - e.g. **numerical reputation measures**
- Lightweight evidence
  - e.g. **“accept buttons”**

## They should be integrated for balancing:

- trust level
- risk level
- computational costs
- usability (fetching credentials, personal assistants)

**E.g. micropayments  
vs. buying plane tickets**

# Exploiting “external” systems

## Decisions need data, information, and knowledge

- Each organization has its own
  - Already available through **legacy software and data**
  - A realistic solution *must* interoperate with them
- Third parties
  - Credit card sites for validity checking
  - Credential repositories
- Variety of web resources
- Protune: special syntax for external calls

# Explanation mechanism

## Main challenge:

- Finding the right tradeoff between
  - Explanation quality (2<sup>nd</sup> generation explanation facilities)
    - Remove irrelevant information
    - User-friendly denotation of internal objects
    - User-oriented description of reasoning
  - Framework instantiation effort
    - The framework needs to be adapted to each application domain
    - Expensive in 2<sup>nd</sup> generation EF (ad hoc KB and engine)
    - Reduce the need for specialized staff
  - Computational load

# Protune's explanation facility

- Supported queries
  - Why / Why not (for explaining negotiations)
  - How to (for explaining policies)
  - What if (for validating policies)
- Explanations can be built on clients
  - Almost no overhead on servers
  - Scalable approach

# Controlled natural language specs

- We are aiming at specifications like

*Credit cards can be released to BBB members if the cost of the purchased item is at least 100 euros*

- Based on an evolution of the Attempto system for controlled natural language processing

<http://www.ifi.unizh.ch/attempto/>

# Protune is evolvable

- Two powerful mechanisms
  - Rule libraries
  - Metapolicies
- For language extensions
- For controlling negotiations

# DISCUSSION

[ More on [http : //reverse.net/i2/](http://reverse.net/i2/) ]

# Why-not demo

## sample screenshot

Explain why it is not allowed to download paper\_0123.pdf - Mozilla

**REVERSE**  
WG I2 - policy language

**PROTUNE Why-Not Explanations**

it is not allowed to download paper\_0123.pdf because:

- Rule [3] cannot be applied:
  - paper\_0123.pdf is not public [[details](#)]
- Rule [4] cannot be applied:
  - I find no User such that the User is authenticated [[details](#)]
- Rule [5] cannot be applied:
  - I find no User such that the User is authenticated [[details](#)]
  - I find no User such that the User paid for paper\_0123.pdf [[details](#)]

[Policy file](#)

Done

# Why-not demo

Explain why it is not allowed to download paper\_0123.pdf - Mozilla

**REVERSE**  
WG I2 - policy language

**PROTUNE Why-Not Explanations**

it is not allowed to download paper\_0123.pdf because:

- Rule [3] cannot be applied:
  - paper\_0123.pdf is not public [[details](#)]
- Rule [4] cannot be applied:
  - I find no User such that the User is authenticated [[details](#)]
- Rule [5] cannot be applied:
  - I find no User such that the User is authenticated [[details](#)]
  - I find no User such that the User paid for paper\_0123.pdf [[details](#)]

[Policy file](#)

Done

# Why-not demo

## sample screenshot

Explain why the User is not authenticated - Mozilla

**REVERSE**  
WG I2 - policy language

**PROTUNE Why-Not Explanations**

the User is not authenticated because:

- Rule [7] cannot be applied:
  - I find no Credential such that the Credential is an id [\[details\]](#)
- Rule [8] cannot be applied:
  - I find no Form such that the Form is a declaration [\[details\]](#)
- Rule [9] cannot be applied:
  - the procedure on <http://lol.com/register.php> has not (yet) been successfully completed [\[details\]](#)

[Policy file](#)

# Why-not demo

## after one more step...

Explain why the Card is not a valid credential - Mozilla

**REVERSE**  
WG I2 - policy language

**PROTUNE Why-Not Explanations**

the Card is not a valid credential because:

- Rule [19] cannot be applied:
  - c012 is a credential whose *issuer* is Open University

**but**

○ I find no Key such that the Key is the public key of Open University

[\[details\]](#)
