Deutsche Telekom Laboratories

W3C SIV Workshop (Menlo Park, March 5-6, 2009)
 Ingmar Kliche, Martin Eckert

W3C SIV Workshop. Agenda.

- SIV Architecture
- Use cases
- SIV syntax
- Conclusion

W3C SIV Workshop.

What should SIV in VoiceXML 3.0 support?

Combination of SIV with other resources (esp. ASR) :

- SIV only (i.e. without ASR, standalone SIV)
- SIV in parallel to ASR (ASR and SIV are separate resources)
- SIV integrated with ASR as one (combined) resource

SIV types:

- Text independent
- Text dependent
- Text prompted

Decision control:

- Either the SIV engine or the application may control decisions (e.g. regarding acceptance/rejection)

W3C SIV Workshop.

SIV Core Functionality in VoiceXML 3.0.

SIV must support:

- Enrollment
- Verification
- Identification

- Save voiceprints (after enrollment)
- Load voiceprints (before verification/identification)

Note: V3 should load/store voiceprints implicitly (without explicit markup)

Further basic/core functionalities for application development:

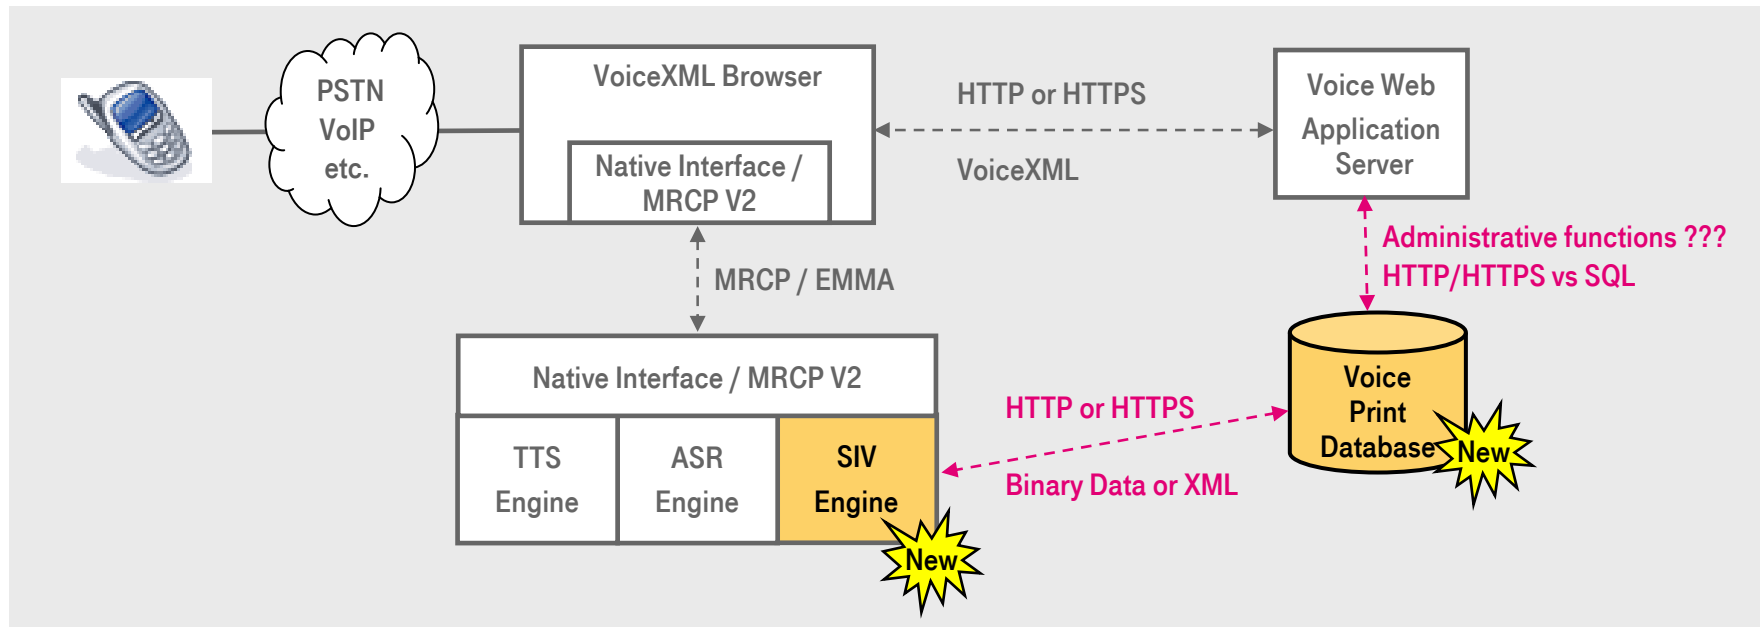

- Adaptation of voiceprints (during verification)
- Buffering of user utterances for later use
- Rollback/Undone of last turn
- Query SIV results (e.g. accept/reject information, score etc.)
- Catch SIV events (e.g. “noinput” or “nomatch” events)
- Query, copy, delete voiceprints (administration purposes) ⇒ outside of VoiceXML 3.0

W3C SIV Workshop.

SIV Architecture.

Proposed Architecture

- Standard VoiceXML architecture extended by MRCP-based SIV engine and voiceprint store

W3C SIV Workshop.

SIV Architecture.

Architectural key statements

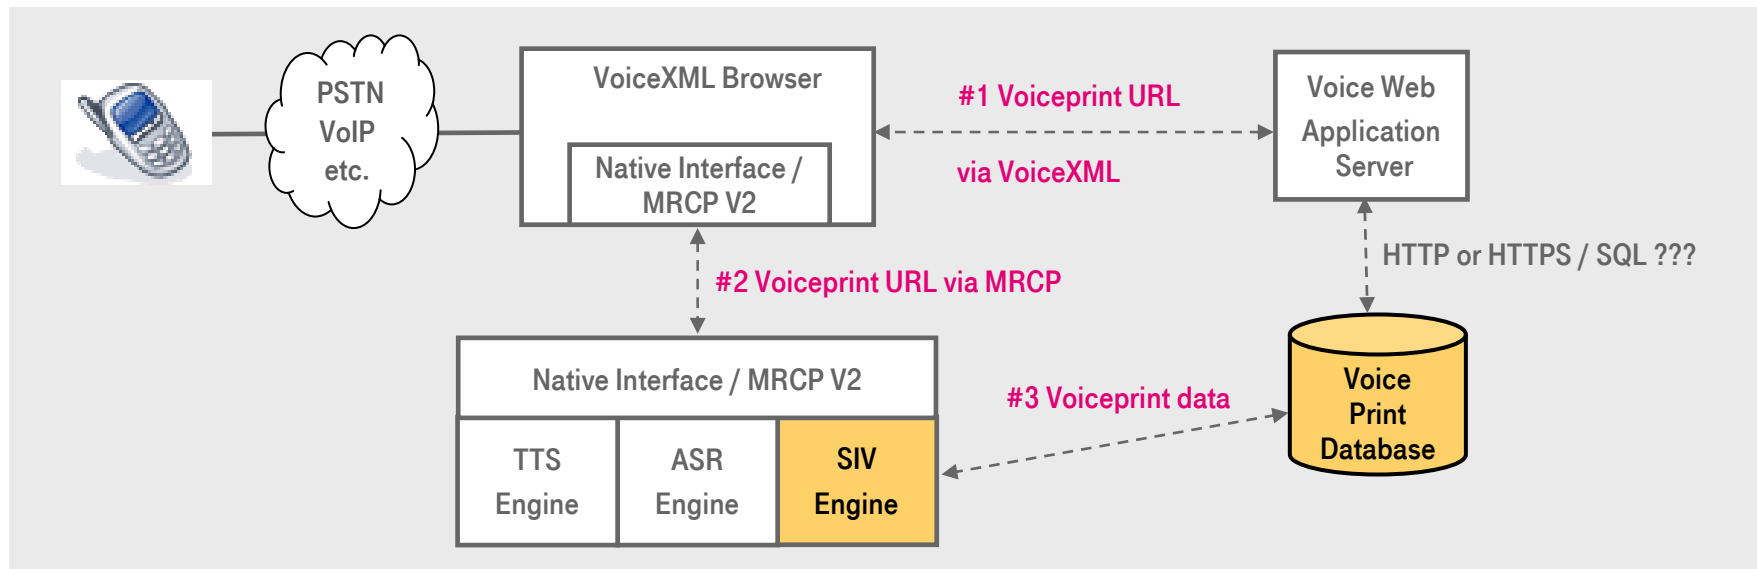

- Support MRCP v2 for integration of SIV engines
 - SIV engine should be integrated using a standardized interface to allow flexible replacement of SIV resources (product replacement).
- Extend MRCP vs. limited SIV functionalities
 - Some SIV vendors require functionalities which are not covered by MRCP v2 (e.g. COPY voiceprint, expected utterance). A decision is necessary for either using a standardized interface or to support the full set of SIV features of various vendors.
- Use EMMA for representation of SIV results
 - SIV results should be represented using EMMA standard.
- Use web protocols for voice print transport
 - Use of HTTP/HTTPS provide flexibility in deployment scenarios

W3C SIV Workshop.

SIV Architecture.

Voiceprint management: load and save voiceprints via MRCP

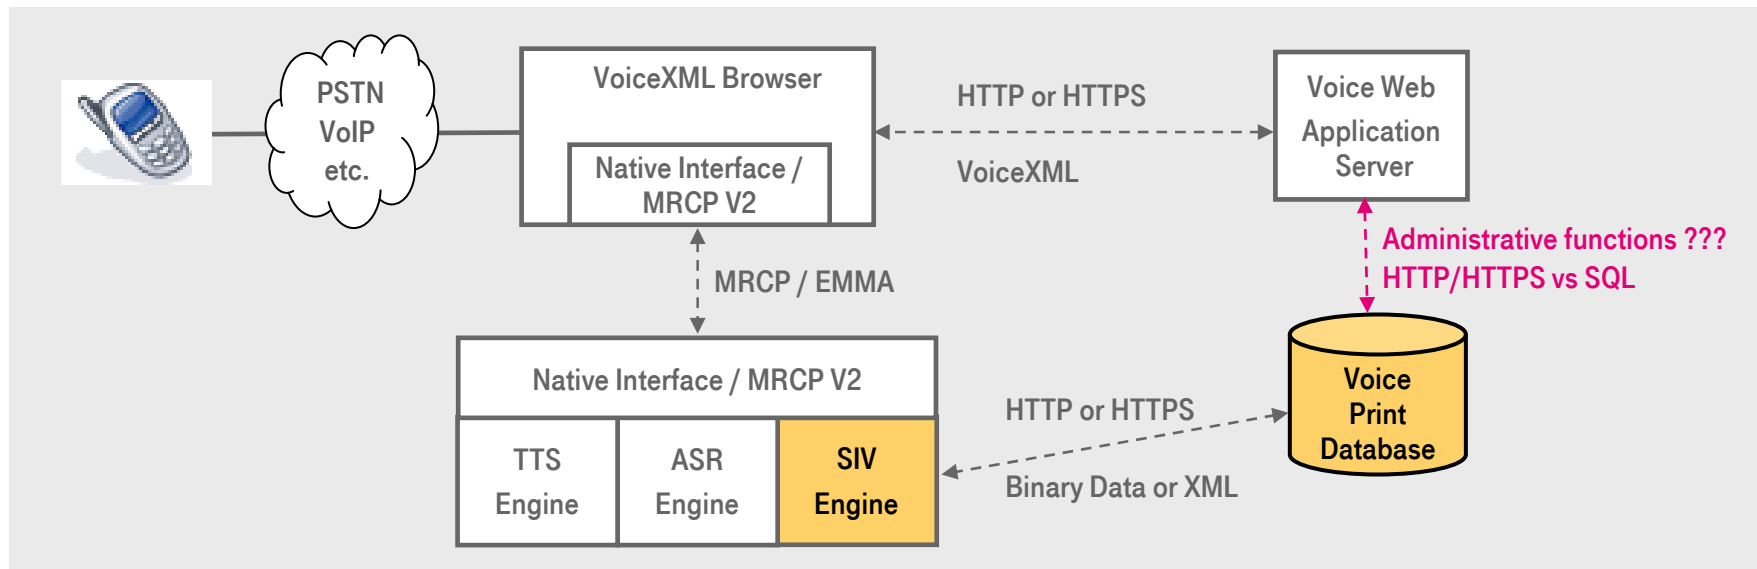

- MRCPv2 supports voiceprint URLs only (i.e. not the voiceprint itself)
- For identification a list of voiceprint URLs or a URL identifying a group will be necessary
- Loading/storing of voiceprints should be implicitly done by V3

W3C SIV Workshop.

SIV Architecture.

Voiceprint management: query/copy/delete voiceprints (Option 1)

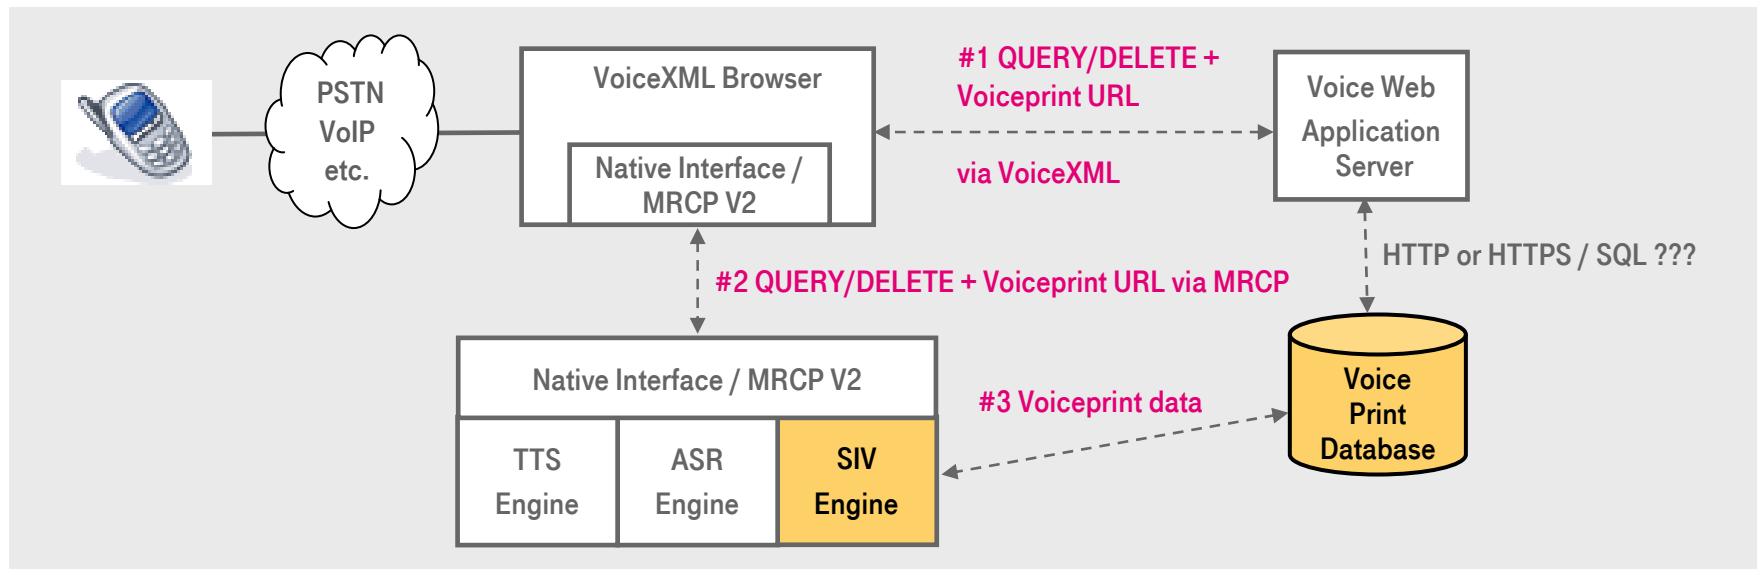

- MRCPv2 does not provide all necessary administrative functions (e.g. COPY).
- Advantages option 1: administrative functions not executed by VoiceXML
- Disadvantage option 1: proprietary interface to voiceprint database.

W3C SIV Workshop.

SIV Architecture.

Voiceprint management: query/delete voiceprints (Option 2)

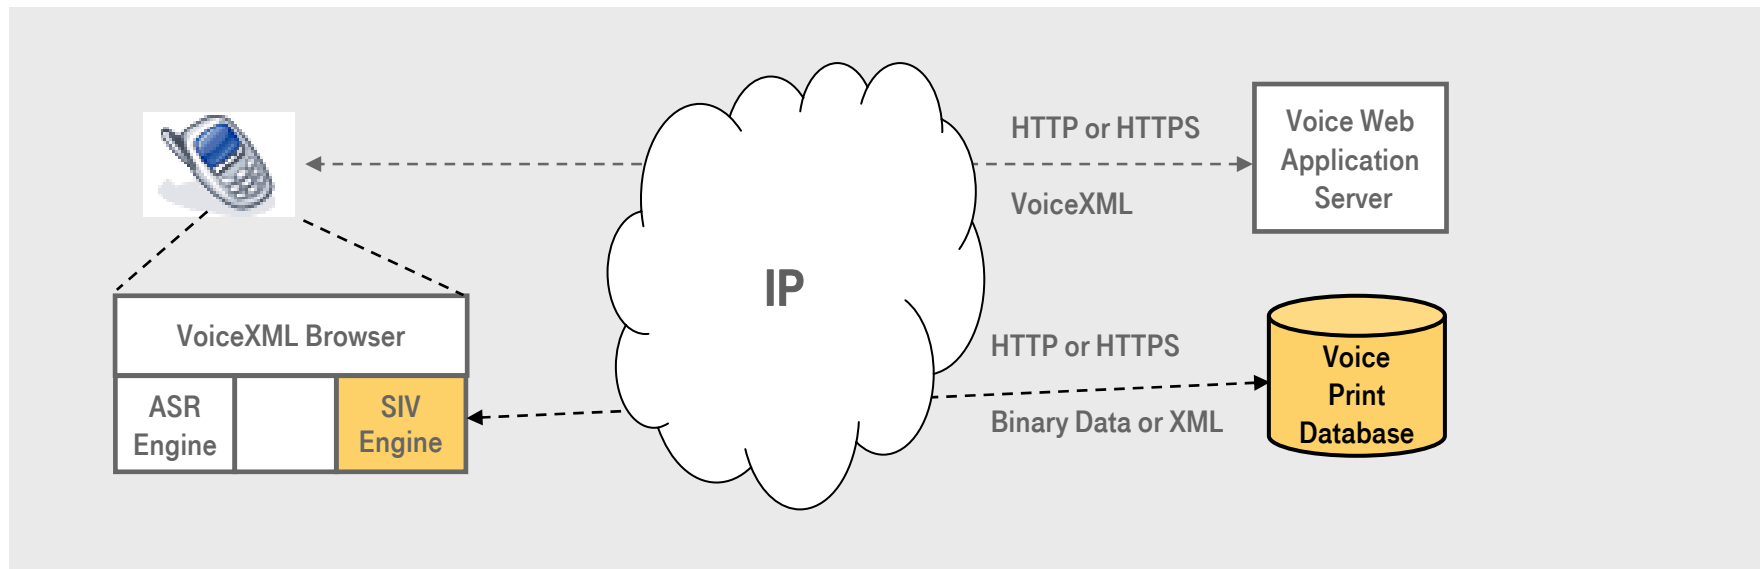

- MRCPv2 supports QUERY and DELETE commands
- Option 2: Reflect QUERY and DELETE at V3 syntax level
- Disadvantage option 2: admin functions executed via VoiceXML

W3C SIV Workshop.

SIV Architecture.

Embedded deployment supported by proposed architecture

- Usage of web protocols (HTTP/HTTPS) for voiceprint transport supports future deployment scenarios

W3C SIV Workshop. Agenda.

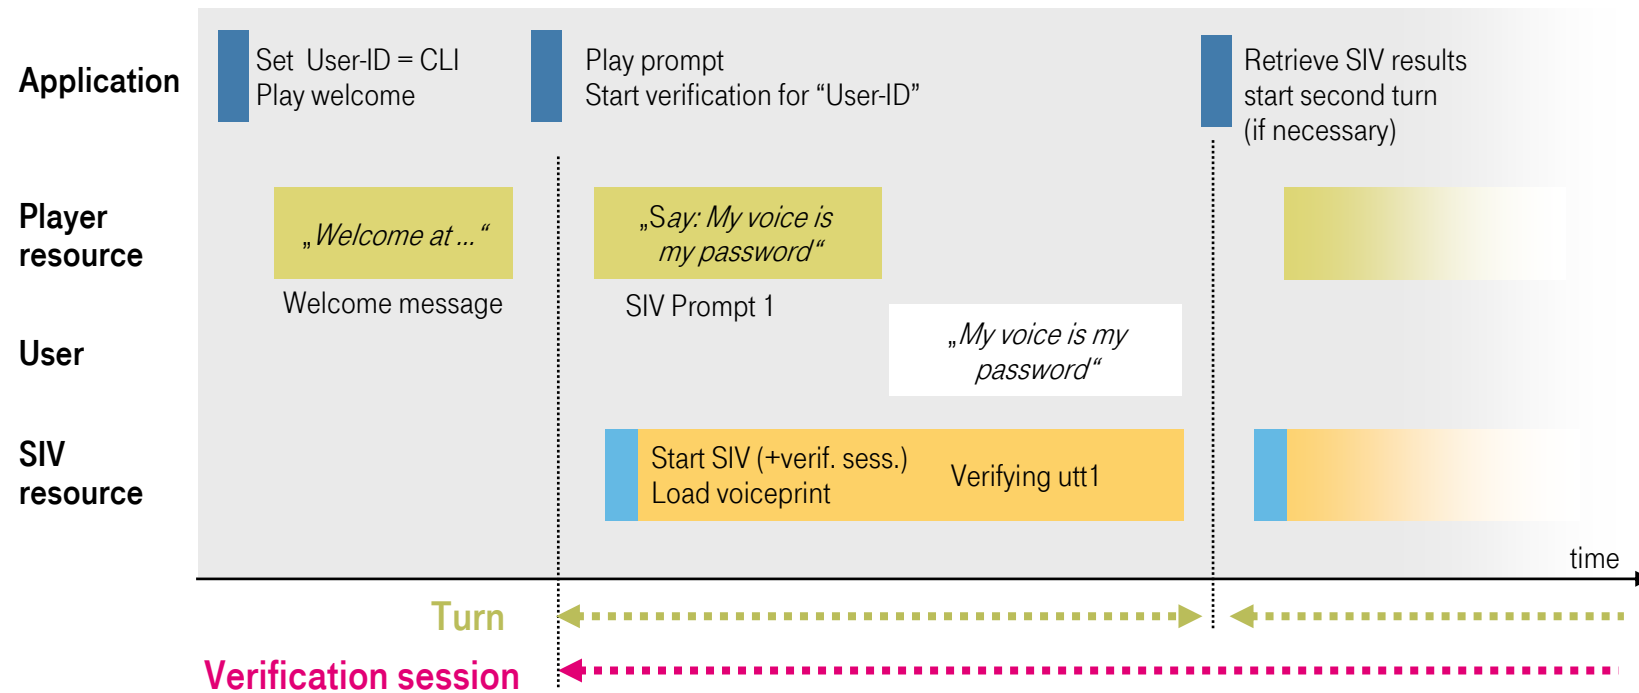

- SIV Architecture
- Use cases
- SIV syntax
- Conclusion

W3C SIV Workshop.

SIV use cases.

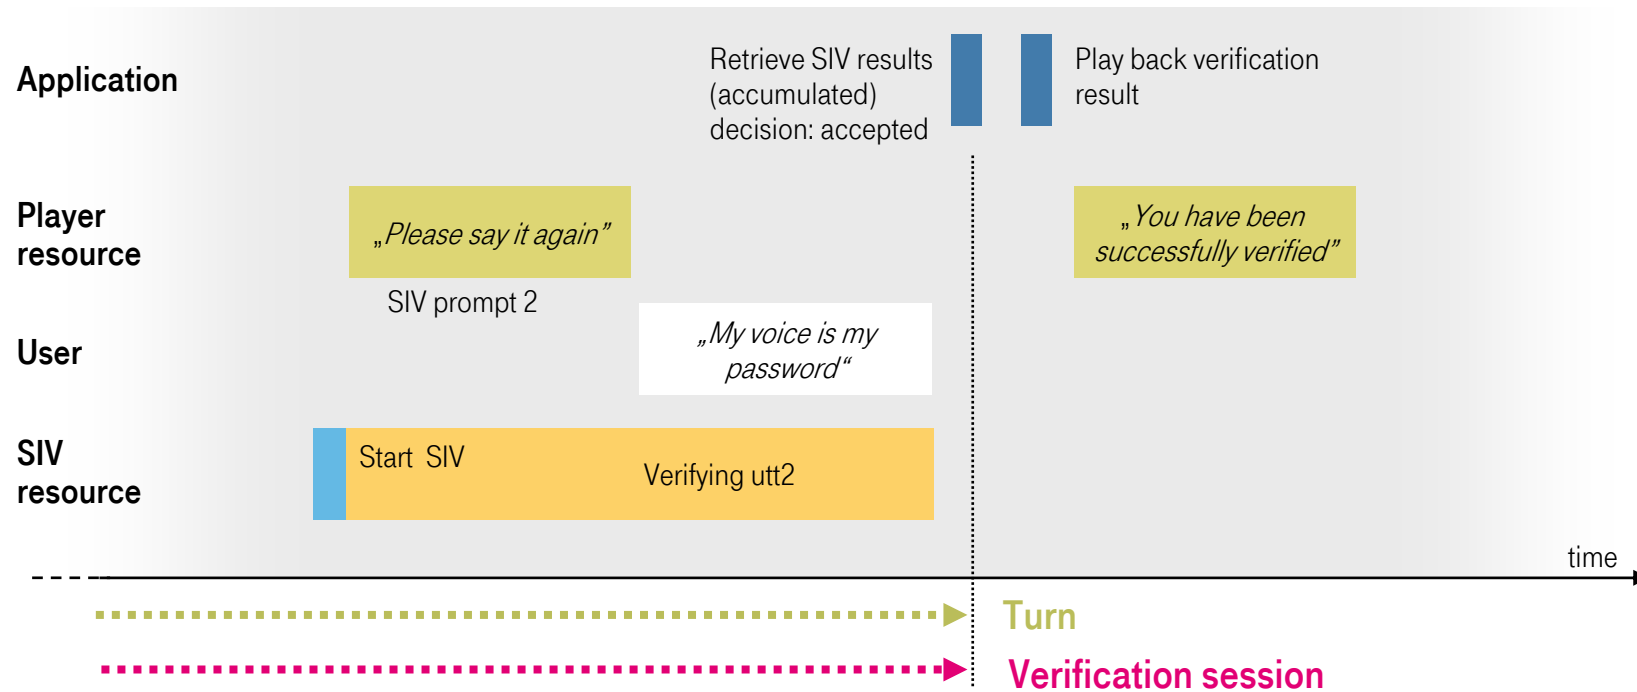

Basic uses case #1: standalone SIV without ASR

W3C SIV Workshop.

SIV use cases.

Basic uses case #1: standalone SIV without ASR (cont'd)

W3C SIV Workshop.

SIV use cases.

Basic uses case #1: standalone SIV without ASR (cont'd)

- SIV needs to implement speech detection/endpointing (like ASR)
- SIV needs to implement timeouts (like ASR)
- SIV should in this use case provide bargein functionality

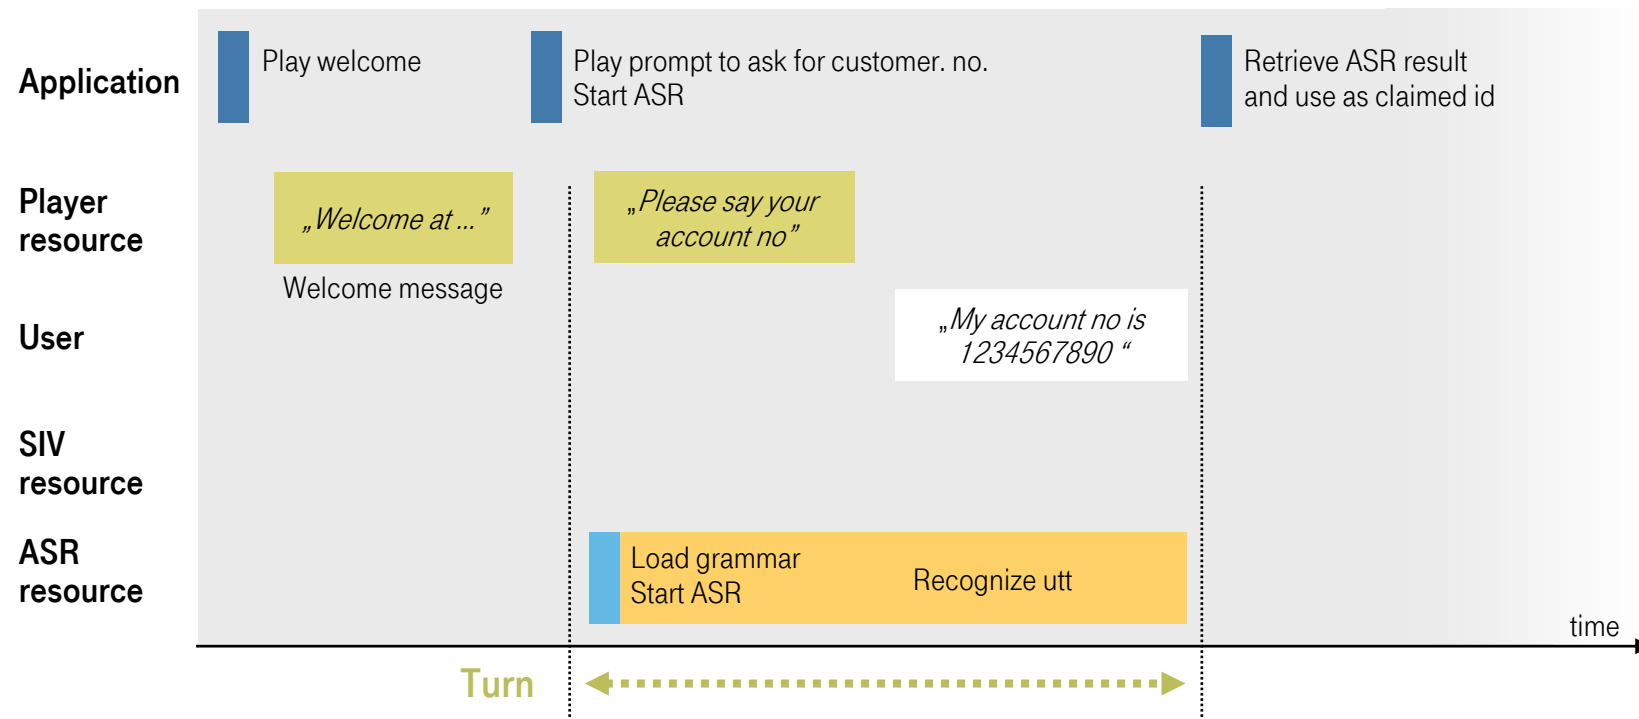

- SIV may need multiple turns (within one SIV session)
- Author needs control of whether another turn is necessary or not (⇒ syntax)

W3C SIV Workshop.

SIV use cases.

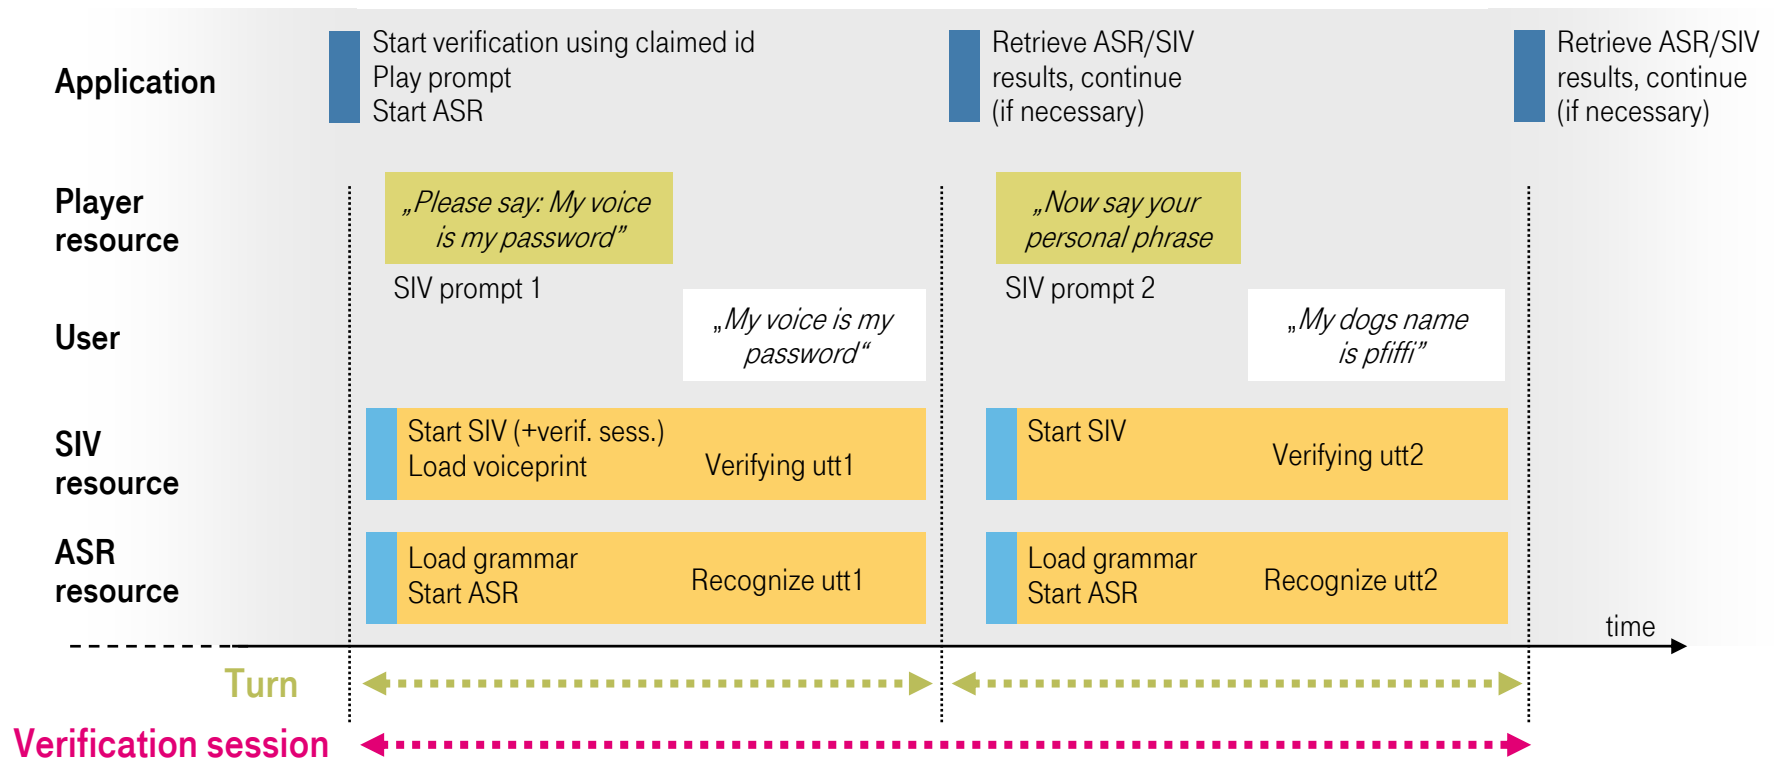

Basic uses case #2: SIV + ASR

W3C SIV Workshop.

SIV use cases.

Basic uses case #2: SIV + ASR (cont'd)

W3C SIV Workshop.

SIV use cases.

Basic uses case #2: SIV + ASR (cont'd)

- SIV may run in parallel to ASR (difference to use case #1)
- Idea: use ASR to make sure that the user repeated the correct (prompted) utterance
- Both ASR and SIV can return events like noinput etc. ⇒ application has to catch them

Issues:

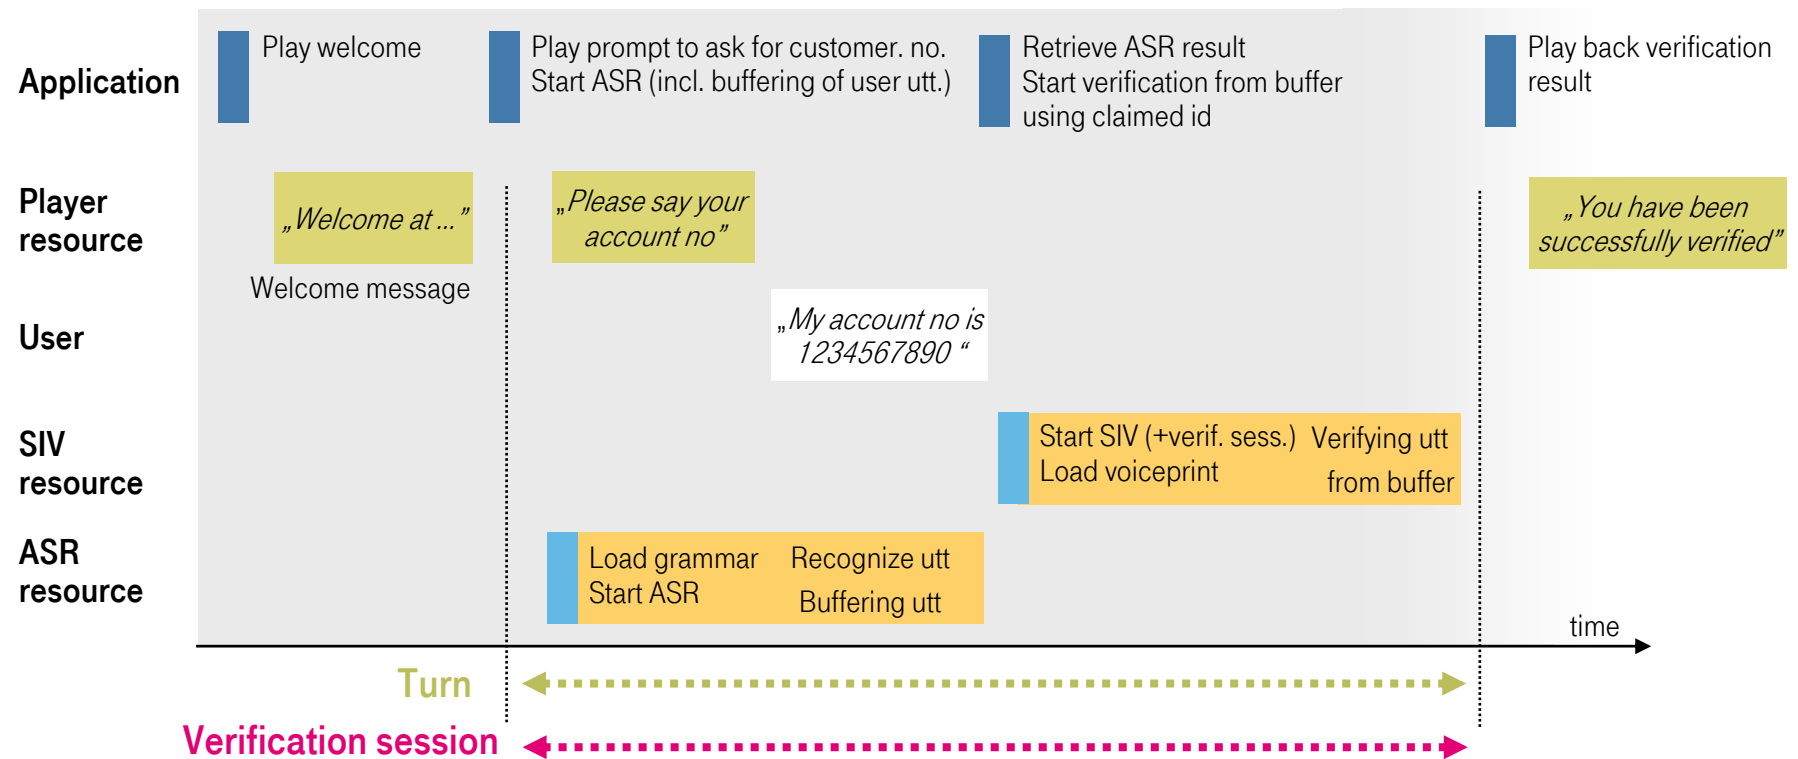

- What if user repeated wrong utterance and ASR is used to check if SIV is not successful? ⇒ conclusion: undone/rollback functions necessary to remove latest utterance from cumulated result
- Problem if engine ended session by itself ⇒ conclusion: session has to be ended by app only
- Same problem if adaptation was enabled ⇒ rollback for adaptation necessary (supported by MRCP thru abort header for end-session method)

W3C SIV Workshop.

SIV use cases.

Basic uses case #3: ASR + SIV from buffer

W3C SIV Workshop.

SIV use cases.

Basic uses case #3: ASR + SIV from buffer (cont'd)

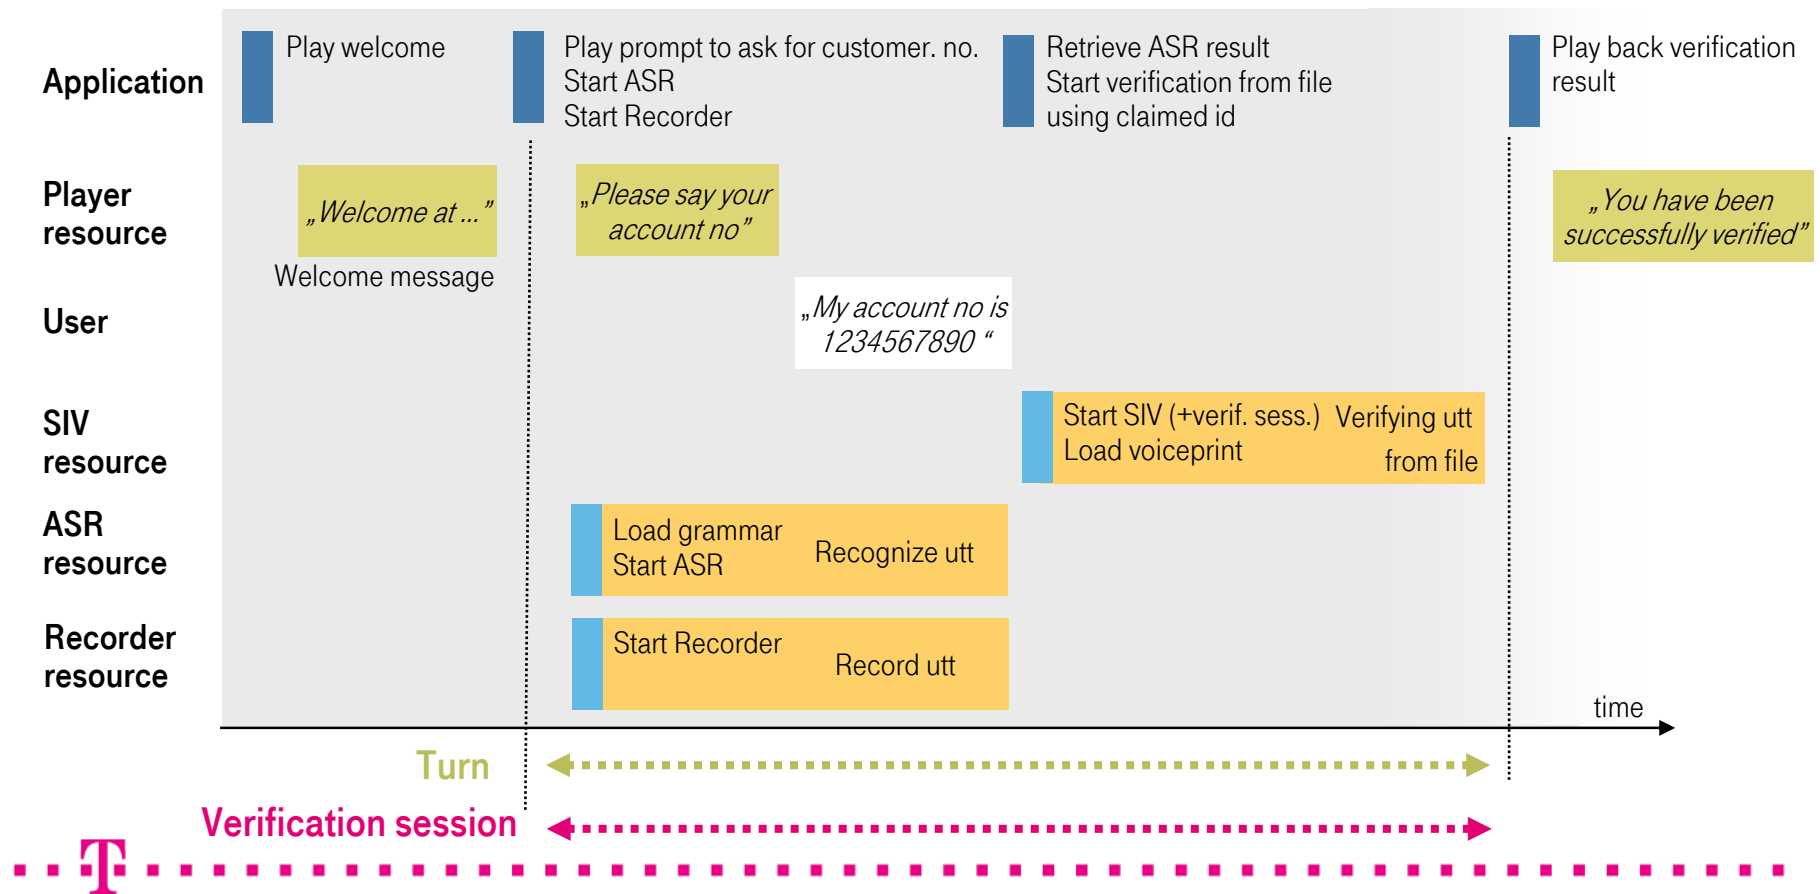

- ASR must be able to buffer one (or more?) utterances for later verification
- Requires new ASR functionality (e.g. new attribute siv_buffer)

W3C SIV Workshop.

SIV use cases.

Basic uses case #4: ASR + SIV from file

W3C SIV Workshop.

SIV use cases.

Basic uses case #4: ASR + SIV from file

- Recorder resource running in parallel to ASR to record user utterance
- Verification of recorded utterance requires special parameter (WAV file reference for verification from file)
- Which audio-formats are supported?

W3C SIV Workshop. Agenda.

- SIV Architecture
- Use cases
- SIV syntax
- Conclusion

W3C SIV Workshop.

SIV vs. ASR.

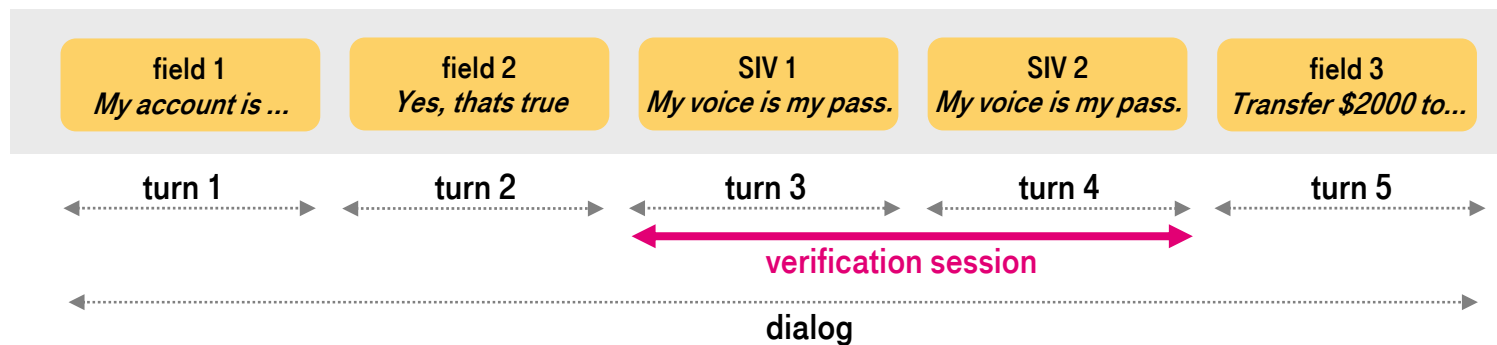

ASR

- ASR dialogs consists of one or more independent turns

SIV

- SIV dialogs consists of one or more turns that are part of an enrollment/verification session

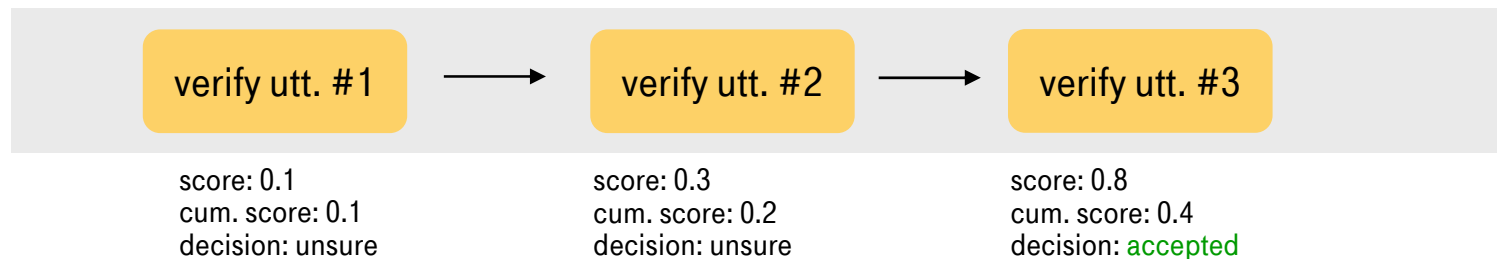

W3C SIV Workshop.

SIV sessions.

Sessions:

- Enrollment and verification/identification can be session based
- SIV engines often compute (internally) cumulative results when verifying several utterances (turns)

- MRCP provides Start-Session and End-Session methods
- Voiceprint-ID (given when session is started) defines which voiceprint to be trained or matched during the enrollment/verification session

W3C SIV Workshop.

SIV syntax.

Inputs for VoiceXML 3.0 SIV elements:

- Mode (enroll/verify/identify)
- SIV-ASR (SIV only, SIV+ASR)
- Adaptation (bool)
- Buffering (for <field>) and “useBuffer” for <siv>
- Req. phrase
- Decision threshold
- Timeouts, like ASR
- ID (voiceprint URL), WAV file reference for verification from file (file URL)
- Rollback

Administrative functions:

- Query/copy/delete function

W3C SIV Workshop.

SIV syntax.

Syntax option 1: Extend existing <field ...> element

- Example:

```
<field name="utt1" siv_type="verify" ...>  
  <voiceprint src="voiceprint_url"/>  
  <grammar src="speech_grammar"/>  
</field>
```

- Advantage:
 - reuse of existing element
- Disadvantages:
 - increased complexity of <field> element
 - control of begin and end of SIV session not sufficient
- Comment
 - multiple fields may belong to a single SIV session and hence use the same voiceprint. Referencing the same voiceprint URL in subsequent <field> is redundant.

W3C SIV Workshop.

SIV syntax.

Syntax option 2: Create one new <siv> element

- Example:

```
<par>
  <siv name="utt1" type="enroll / verify / identify" ...>
    <voiceprint src="voiceprint_url"/>
  </siv>
  <field>
    <grammar src="speech_grammar"/>
  </field>
</par>
```

- Advantage:
 - no increased complexity of <field> element
 - clear separation of SIV and ASR syntax
- Disadvantages:
 - additional element necessary
 - control of begin and end of SIV session not sufficient

W3C SIV Workshop.

SIV syntax.

Syntax option 3: Create a new element for each of the 3 basic functions:

- Example:

```
enrollment      <enroll ...>
verification    <verify ...>
identification   <identify ...>
```

- Advantage:
 - better control of meaningful combinations of attribute values
 - example: `<siv type="enroll" adaptation="true" ... >` is not meaningful, whereas `<enroll>` would not have a adaptation attribute

W3C SIV Workshop.

SIV syntax.

Open issues:

- Control of begin/end of SIV session
- Session needs to be closed by application (to allow control of rollback)
- How to execute a rollback? Separate `<rollback>` element?

W3C SIV Workshop.

SIV results.

Training:

- more_data_needed [true, false]
- decision [accepted, rejected, undecided]
- score (0 ... 100, 50 = decision threshold)

Verification:

- more_data_needed [true, false]
- decision [accepted, rejected, undecided], cumulative and local
- score (0 ... 100, 50 = decision threshold), cumulative and local
- adapted [true, false]

Identification:

- more_data_needed and adapted like for verification
- array of decision, score and voiceprint-ID

⇒ These are core results, should be mandatory within VoiceXML 3.0

W3C SIV Workshop.

SIV results.

Additional results:

- Various vendors provide more results. Most of them are nice-to-have.
- ⇒ Could be optional within VoiceXML 3.0

Examples:

- valid [true, false] (is the utterance valid?)
- device [cellular phone, electret phone, carbon button phone]
- gender [male, female]
- matched (is gender and device type same as in training?)
- num_utterances (number of utterances)
- ...

⇒ **Proposal:** Collect list of results of existing technologies and generate list of mandatory results.
Decide on whether optional results should be allowed

W3C SIV Workshop. Agenda.

- SIV Architecture
- Use cases
- SIV syntax
- Conclusion

W3C SIV Workshop.

Other open issues.

The following issues have not been addressed here:

- Events: SIV might generate a “noinput” event, a combination of SIV and ASR leads to doubled or conflicting events
- Timeout parameters: Should SIV and ASR always use the same timeouts? Different resources (e.g. from different vendors) may behave inconsistently on the same timeouts.

W3C SIV Workshop.

Summary / Conclusion.

Similarities and differences between ASR and SIV

- SIV and ASR share some similarities, but do also have a lot of differences (e.g. SIV session)

Detailed requirements / use case description necessary:

- VoiceXML 3.0 requirements document contains a very generic set of SIV requirements
- For a further discussion, a common understanding regarding use cases is necessary

Proposed next steps:

- Collect and describe use cases **in detail**, to achieve a common understanding
- Decide which use cases to support in VoiceXML 3.0 (and which not)
- Collect list of (mandatory) results and decide whether optional results will be allowed
- Compare with MRCP and decide what functionality from MRCP also to support in VoiceXML 3.0
