Without 'break-after: avoid'

Typographers try to avoid that a heading gets separated from the paragraph that follows it. If the heading is at the bottom of a page or a column and the next paragraph is on the next page or in the next column, the heading is more difficult to recognize and the paragraph is also not immediately seen as the first one of a separate section. It is better in such a case to leave the bottom of the page or the column empty and put the heading on the next page or in the next column, so that the paragraph is visually right below it.

In CSS, the properties that control page and column breaks are 'break-before', 'break-after' and 'break-inside'. In this case, we need 'break-after', and we set it on the heading with a value of 'avoid'. That tells the formatter to do its best to avoid a page break after the heading: `H2 { break-after: avoid }`

Typographers page

And that a he next colue of 'avoid'. That telly right below it. In CSS, the heading on the need 'break-after' and 'break-before', 'break-after', and the next paragraphers try to avoid'. That try to avoid that a heaks aragraph is visualso not immediat tells the fore', 'break-aftertry to avoid that a heading gets separated from the paragraph that follows it.

Next column

If the heading is at the bottom of a page or a column and the next paragraph is on the next page or in the next column, the heading is more difficult to recognize and the paragraph is also not immediately seen as the first one of a separate section. In such a case to leave the bottom of the page.

It is better

Or the column empty and put the heading on the next page or in the next column, so that the paragraph is visually right below it.
